Check the Project Web-Site: <http://www.pebble-fp7.eu>

PEBBLE Participants	
1	Technical University of Crete (GR)
2	Fraunhofer Institute for Building Physics (DE)
3	RWTH Aachen University (DE)
4	Graz University of Technology (AU)
5	ARMINES (FR)
6	CSEM (CH)
7	Saia-Burgess Controls (CH)

Project Acronym: PEBBLE

Project Number: 248537

Project Start Date: January 2010

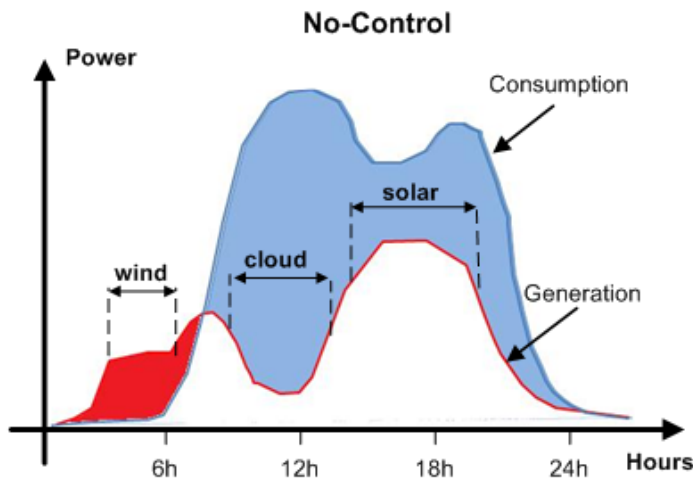

Duration: 3 Years

Funded by: EU FP7

Program Name:
ICT for Energy Efficiency,
FP7-ICT-2009.6.3

Key Issues Toward Energy-Positive Buildings (EPBs)

Area under consumption curve: energy required for building operation.

Area under generation curve: energy available by installed renewable energy sources.

Red Area: Surplus energy available.

Blue Area: Energy purchased from the grid.

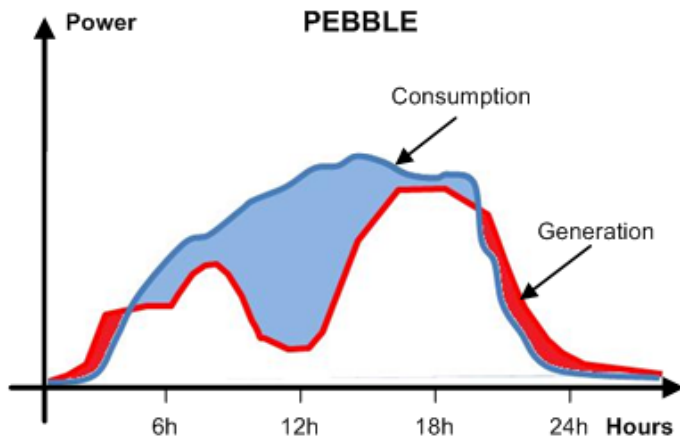

Current View: “Static”

PEBBLE View: “Dynamic”

Select a relevant performance metric, the Net Expected Benefit (NEB) (e.g. the net energy produced over a certain period).

Maximize NEB by:

intelligently shaping demand to perform generation-consumption matching subject to constraints (end-user thermal comfort, atypical availability of energy, reduced capacity demand at a certain time).

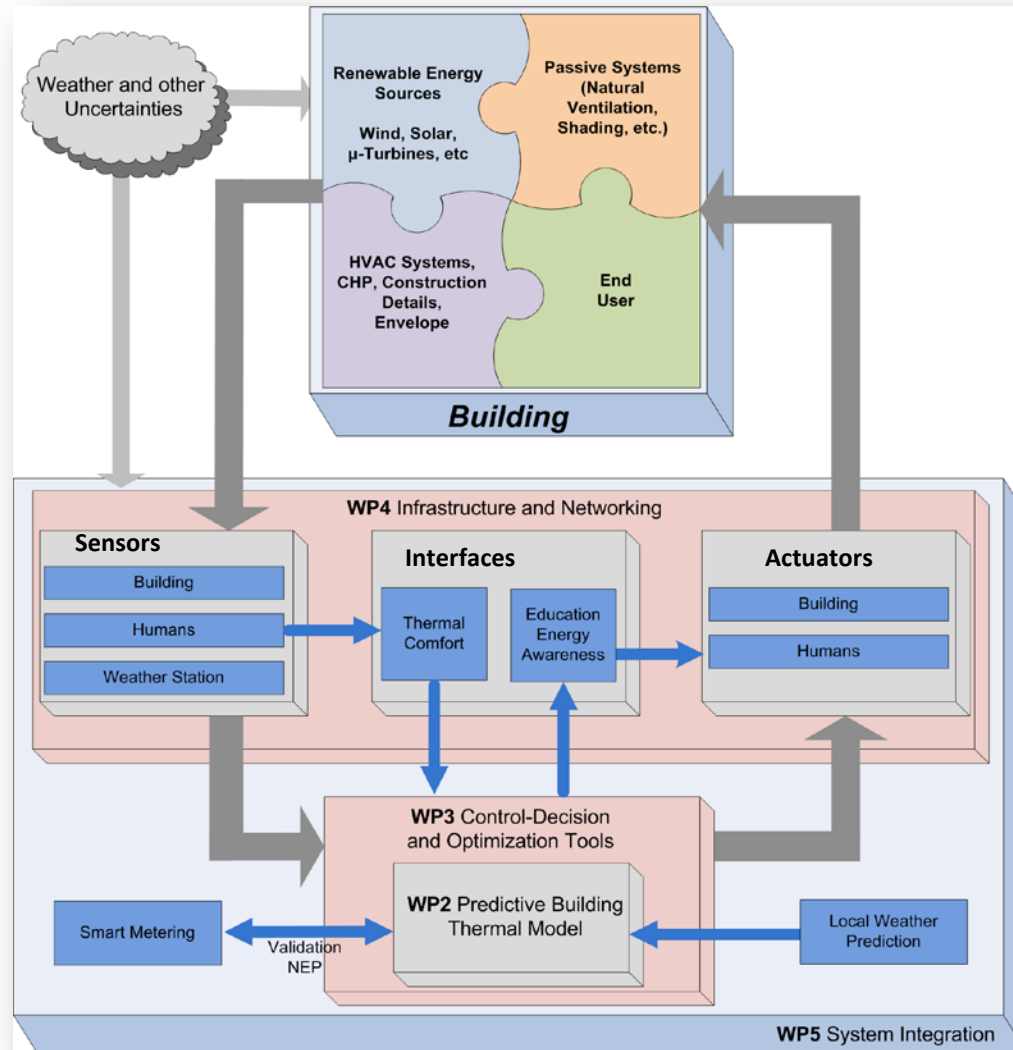

Which Require:

- ▶ Decisions in (almost) real-time:
 - ❑ to operate building subsystems and
 - ❑ to account for:
 - ❑ unpredictable user-behavior,
 - ❑ occupancy scheduling and occupants' activity,
 - ❑ changing weather conditions, and
 - ❑ signals from the grid.

- ▶ These decisions have direct consequences to:
 - ❑ occupant thermal comfort,
 - ❑ energy efficiency, and ultimately
 - ❑ to the Net Expected Benefit (NEB).

- ▶ The complex interplay between the many parameters precludes empiricism or rule-based decisions and necessitates the development of generic decision tools.

PEBBLE Project: Conceptual Schematic...

PEBBLE Demonstration Buildings

1. ZUB (FIBP)

2. RWTH

3. TUC

Integrated thermal modeling

RWTH Aachen

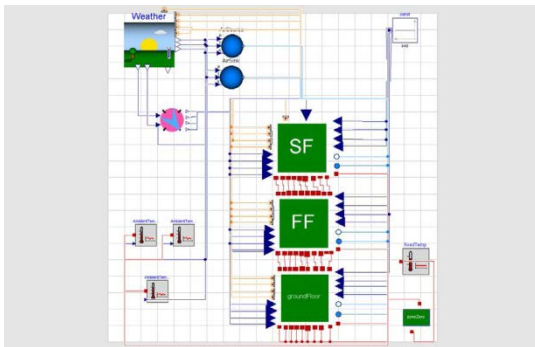

- ▶ Model in Dymola
- ▶ 3 floors
- ▶ 29 thermal zones
- ▶ 4 different zone types
- ▶ Active slabs
- ▶ Façade ventilation units

FIBP Kassel

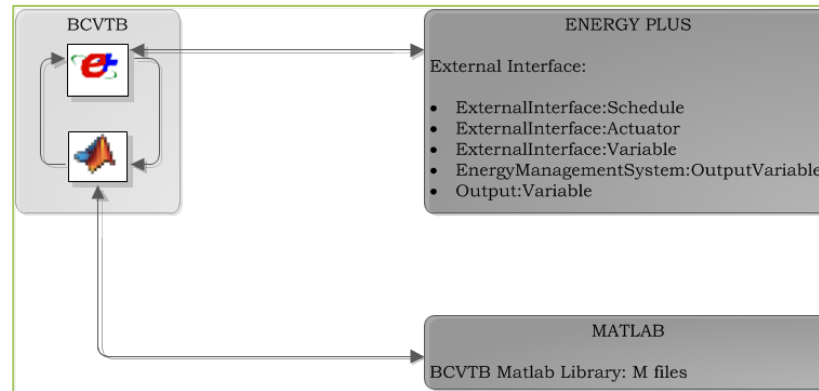

- ▶ Model in TRNSYS17
- ▶ 3 floors, cellar, atrium
- ▶ 29 thermal zones
- ▶ External shading groups included
- ▶ Active slabs

TUC Chania

- ▶ Model in Energy Plus
- ▶ 2 floors
- ▶ 19 thermal zones
- ▶ External shading groups included
- ▶ Natural Ventilation

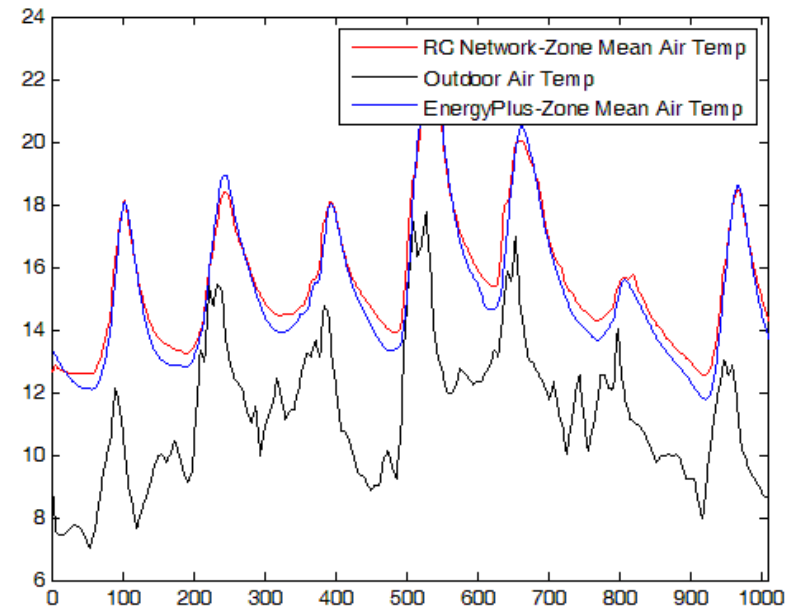

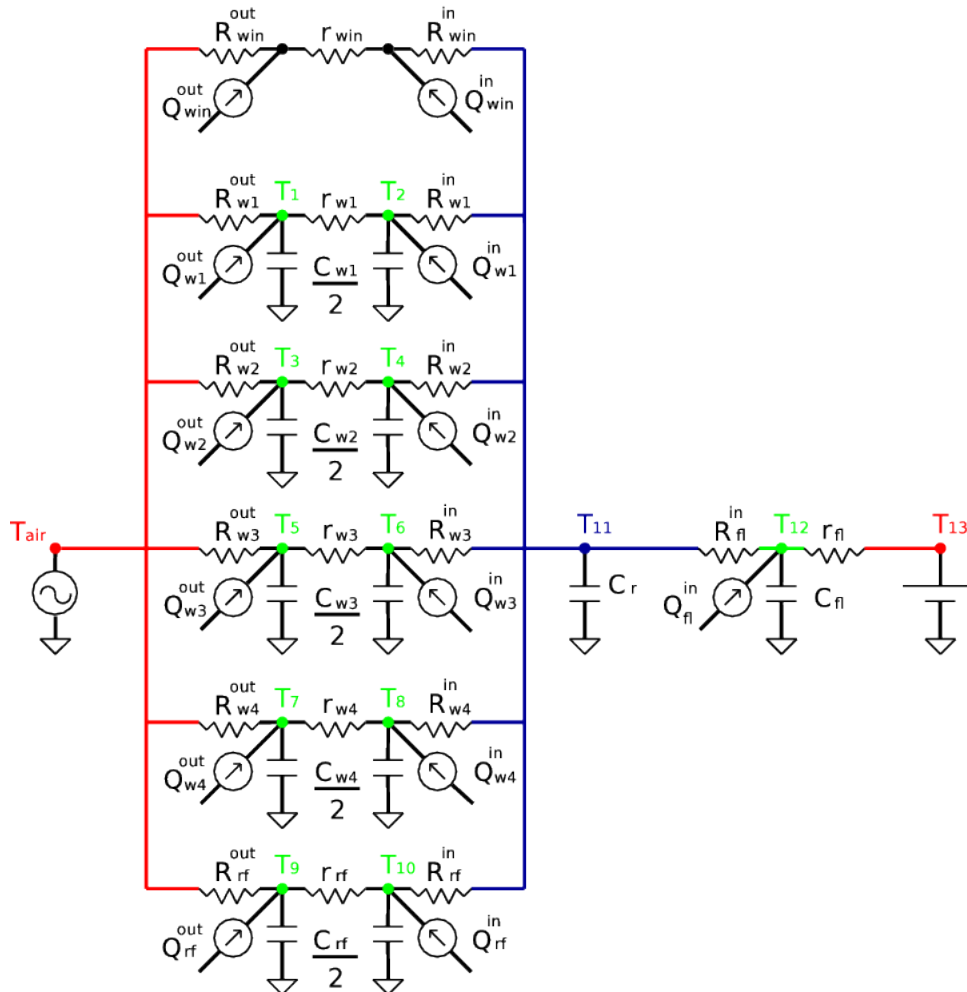

Co-Simulation

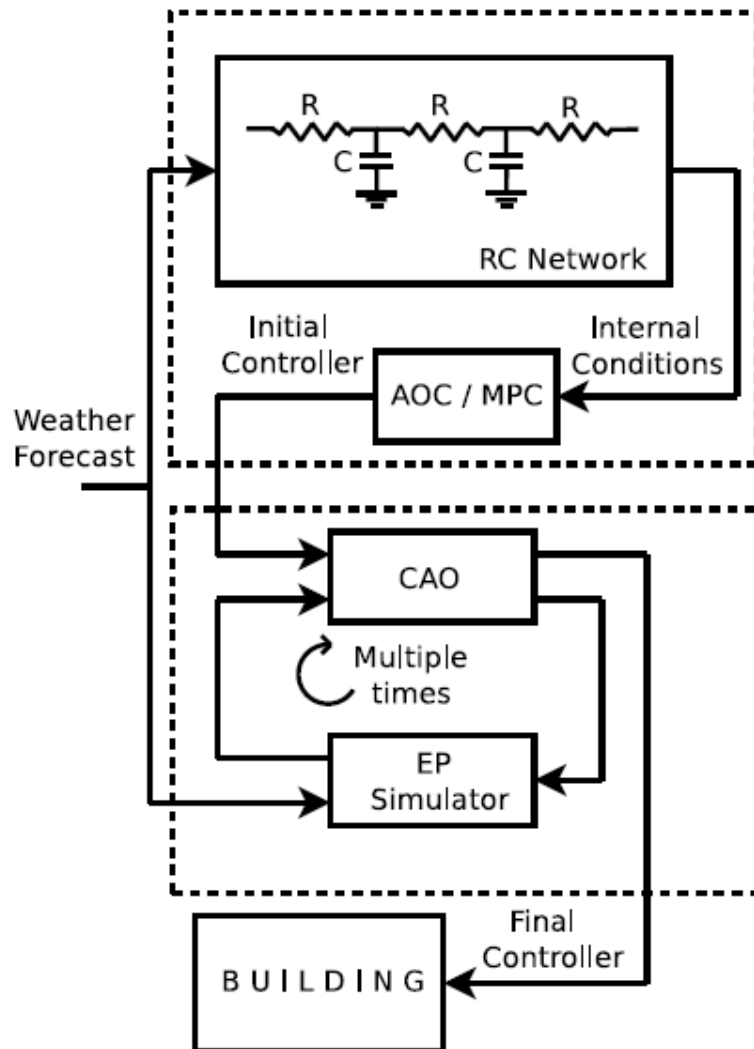

- Establish dynamic connection between Thermal Energy Simulation Engines (EnergyPlus , TRNSYS) and MATLAB.
- Apply control optimization strategies at the model acting as a surrogate of the building.
- Allows for model-identification to create state space models (useful for control design).

Ab initio State-Space Model via RC Network

► One zone example

Model Assisted Control Process

- ▶ Create an RC Network describing the building thermal model
- ▶ Design an Approximate Optimal Control strategy (AOC) to estimate an initial controller
- ▶ Use Cognitive-based Adaptive Optimization (CAO) approach to further fine-tune the initial controller, using an EP Simulator, weather & occupancy forecasts

Control Example

Three-zone building (Real weather data from Chania Greece)

- Variable set point for each of HVAC systems in the zones
- Window opening

Optimization Outcome:

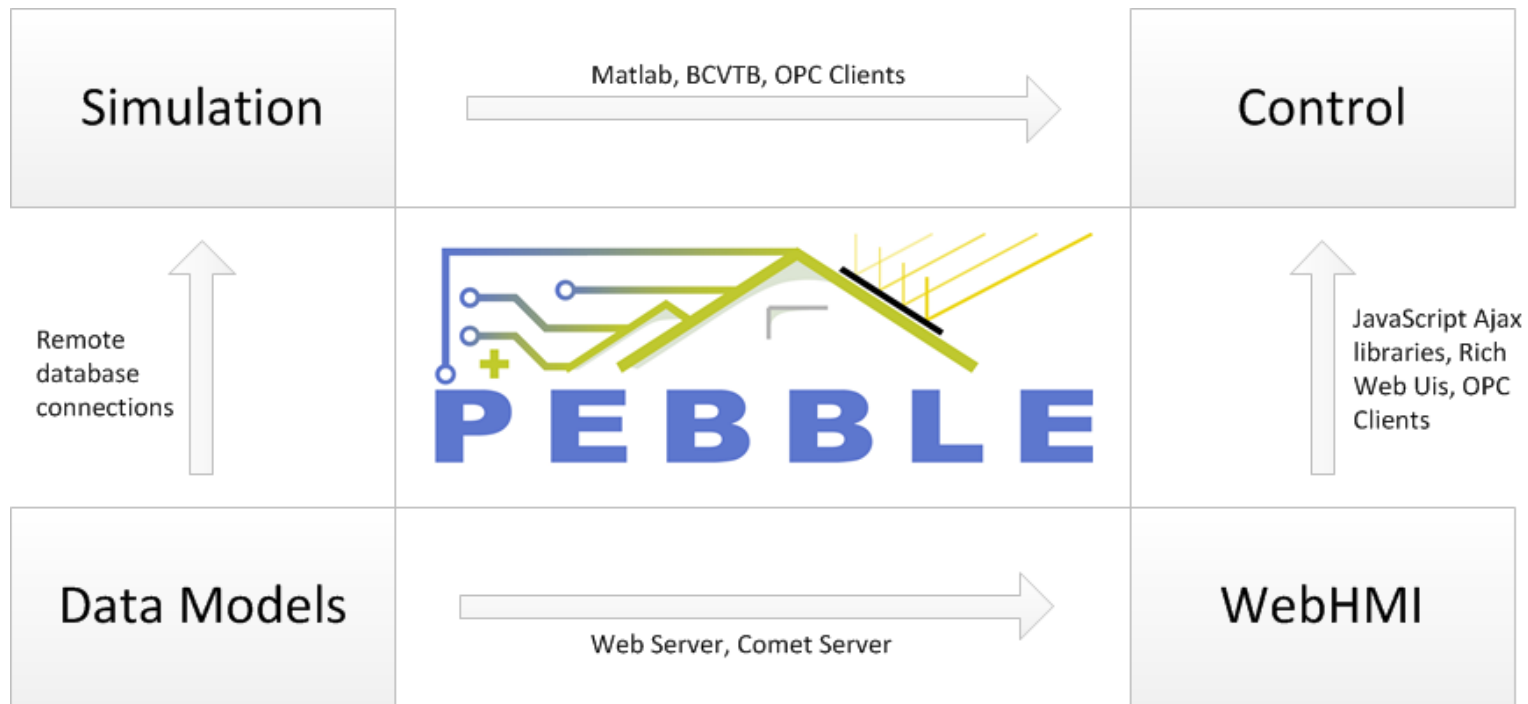

- Night ventilation
- Variable Set Point (adapted to the building occupancy schedules)

Building Optimization and Control Indicative Results

- Energy Saving Potential of over 27% (compared to “good” rule-based control).
- Trade-off between energy consumption and thermal comfort (different metrics yield different strategies)

System Integration

Zone Infrastructure

Wireless devices:

- Temperature sensors
- Humidity sensors
- Occupancy sensors
- Brightness sensors
- Relay actuators

Wired devices:

- Motor controllers
- HVAC actuators
- Energy meters

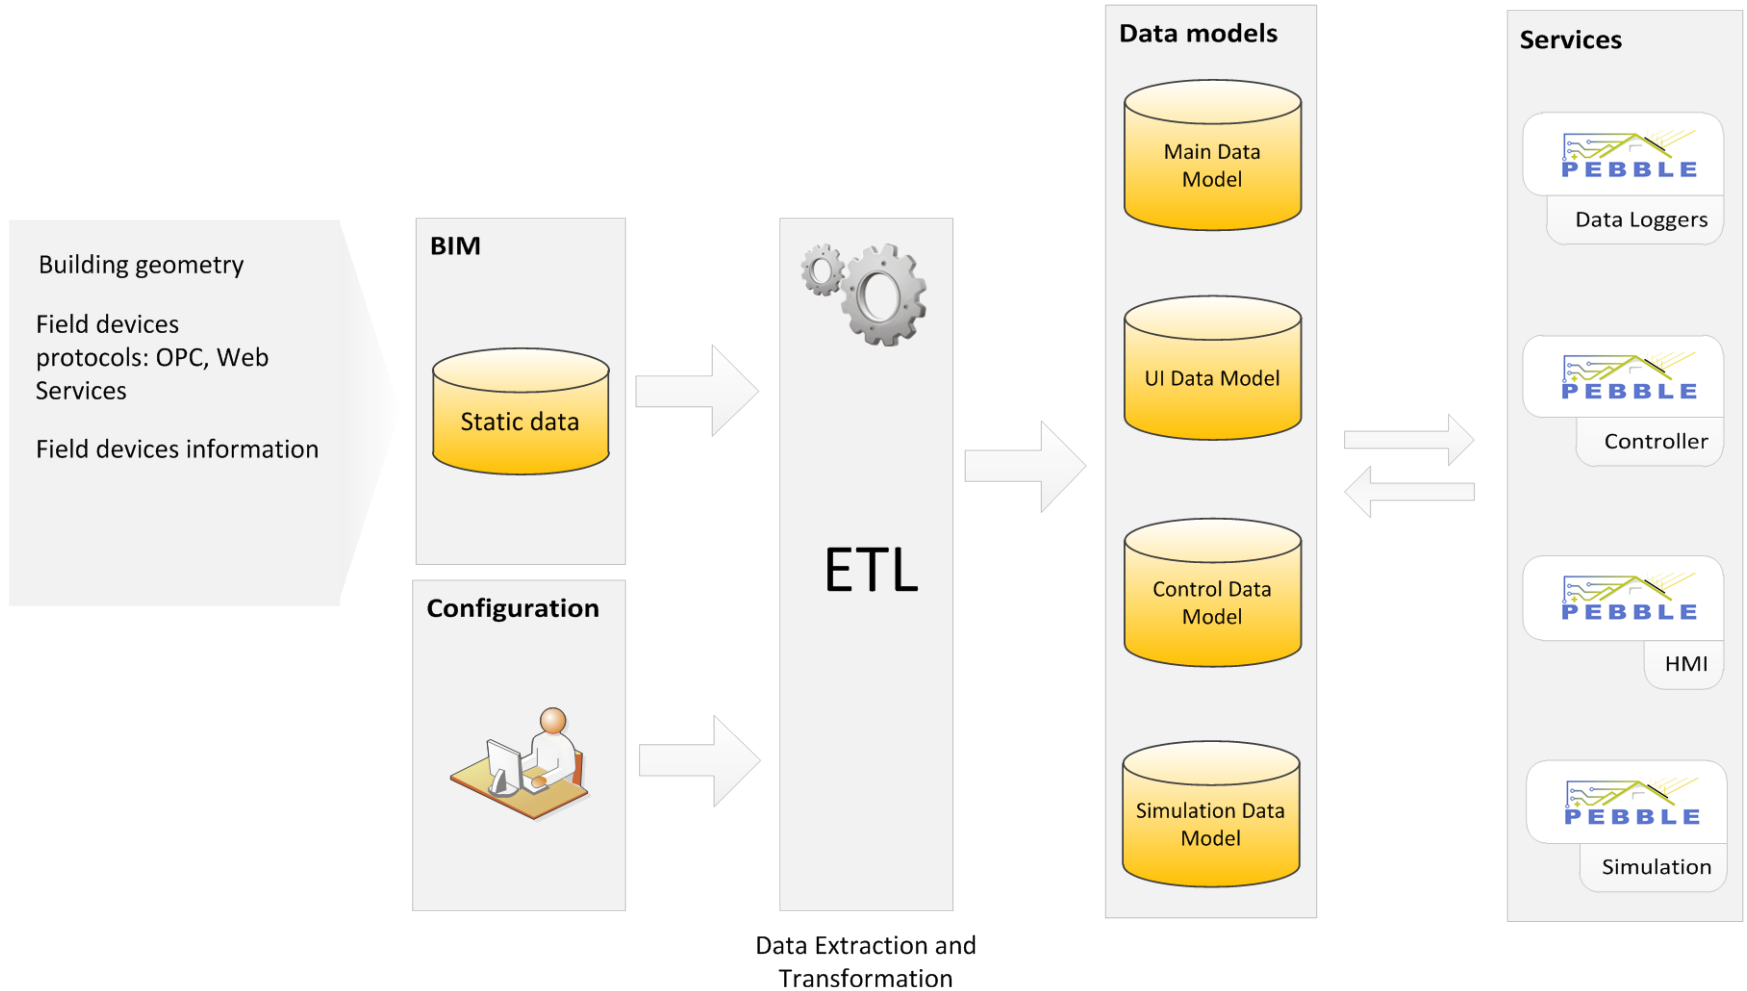

Field devices protocols:

- S-Bus
- EnOcean
- KNX/EIB
- WiseMAC

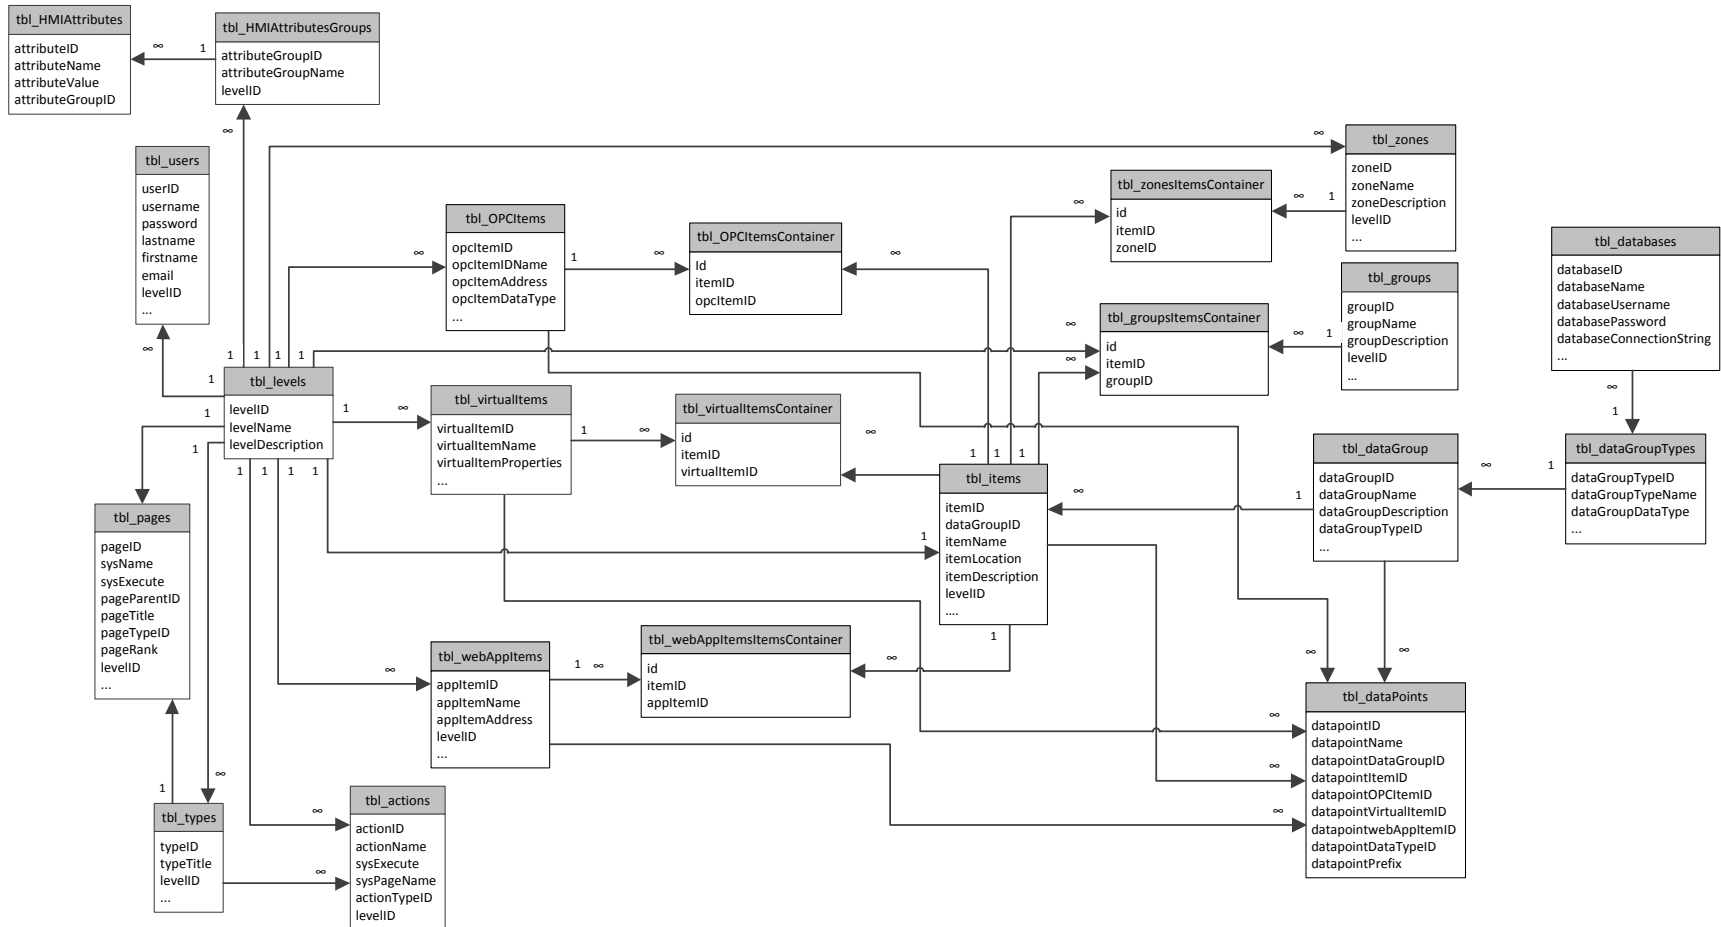

Software protocols:

- OPC (DCOM)
- Web Services (XML, JSON)

Data Model Architecture

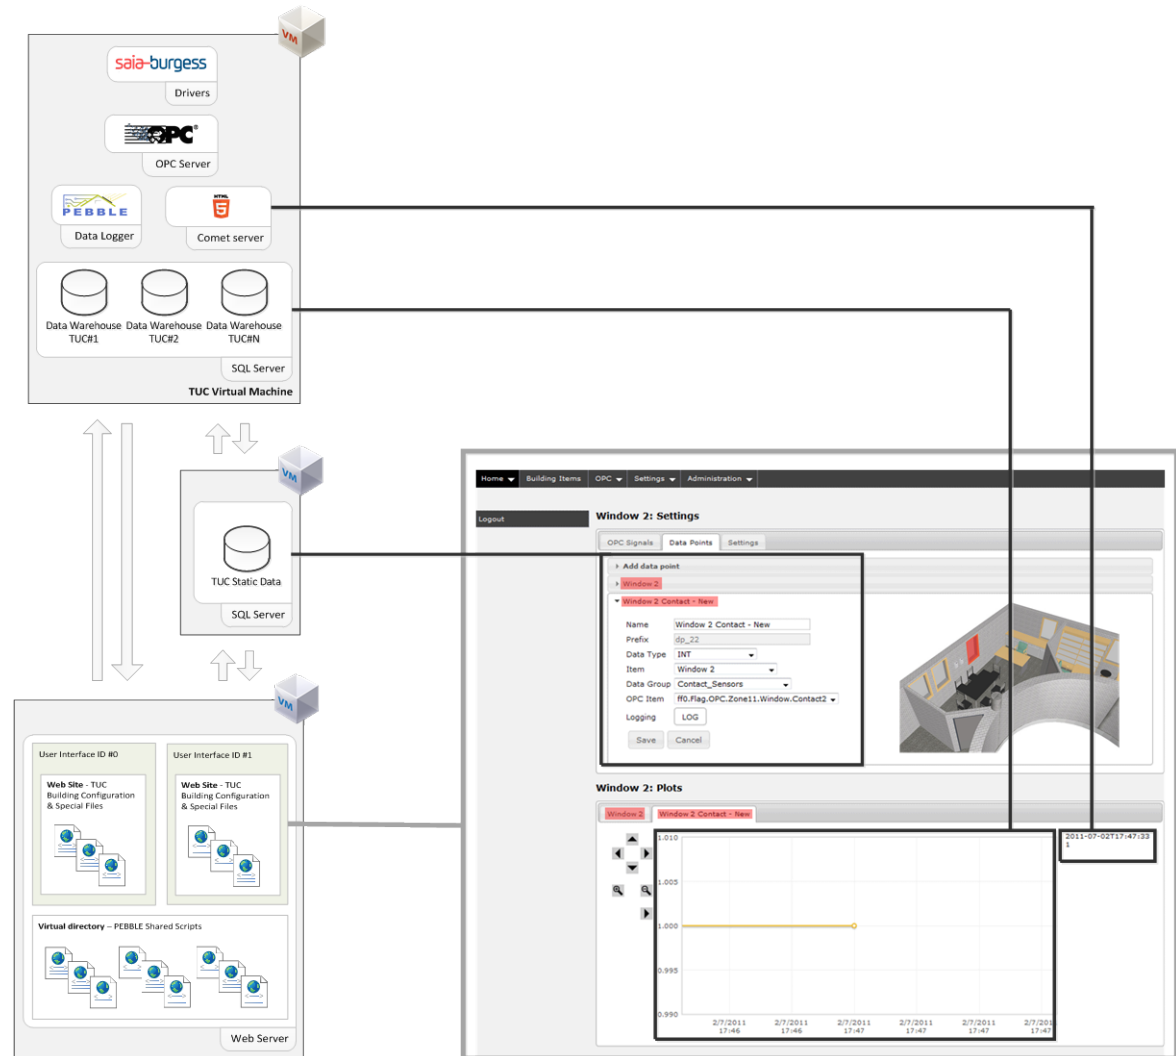

“Main Data Model” Database

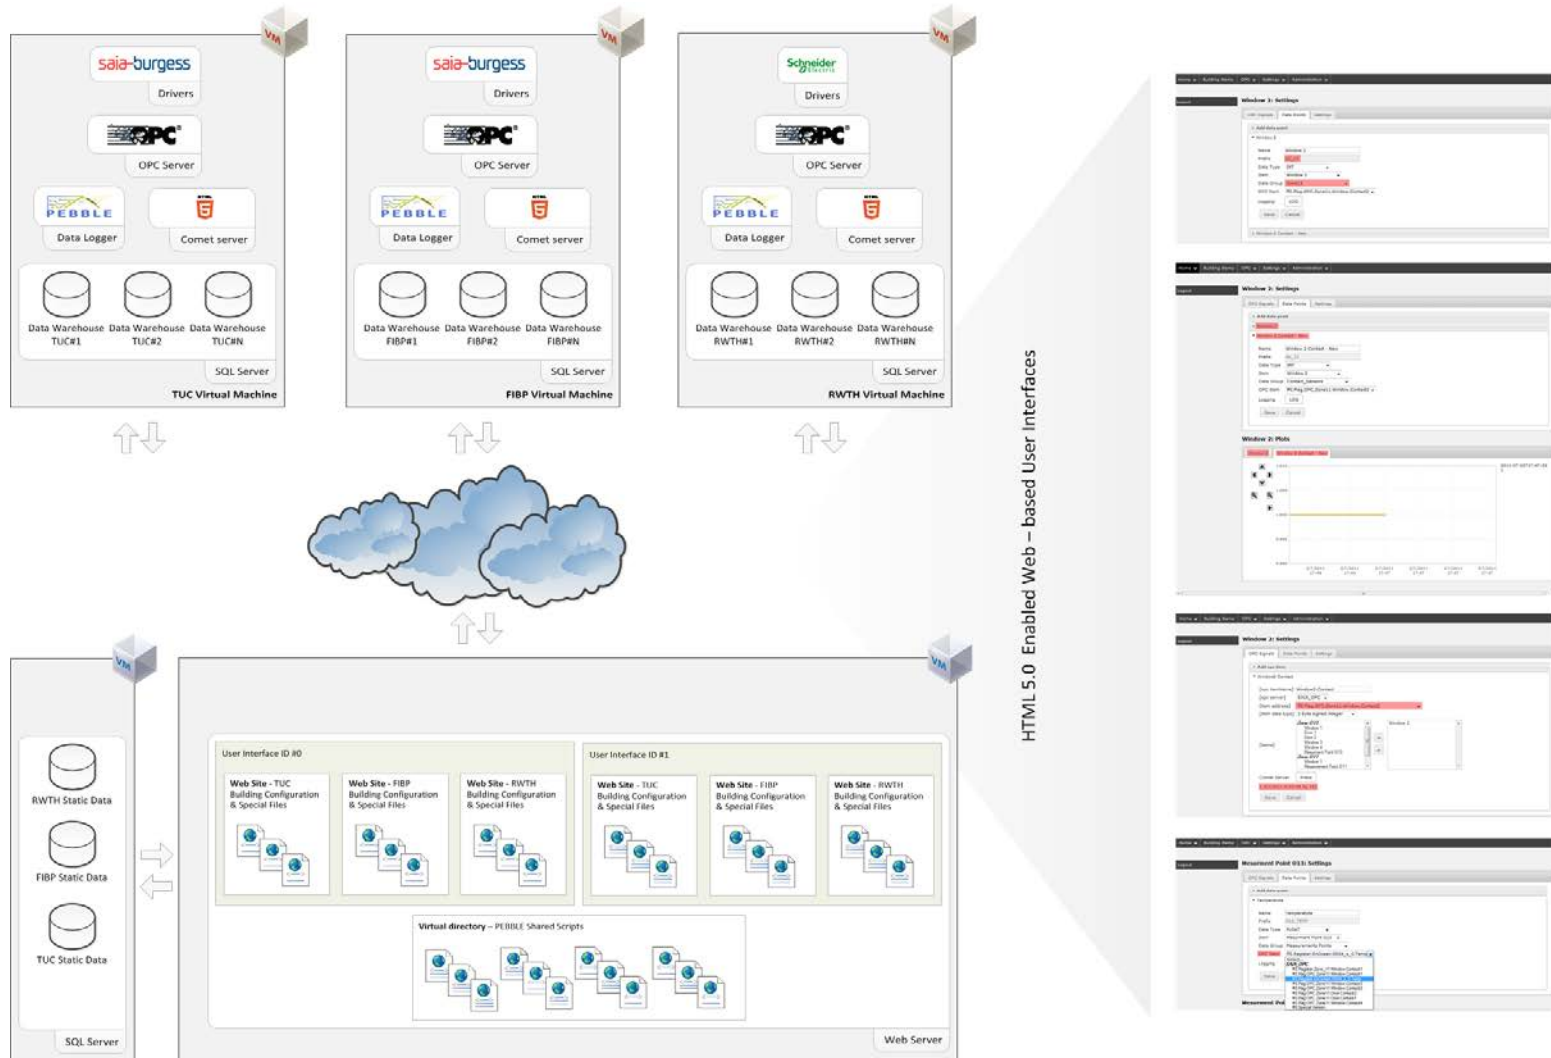

HMI UI – Web Technologies

Web-HMI UI includes:

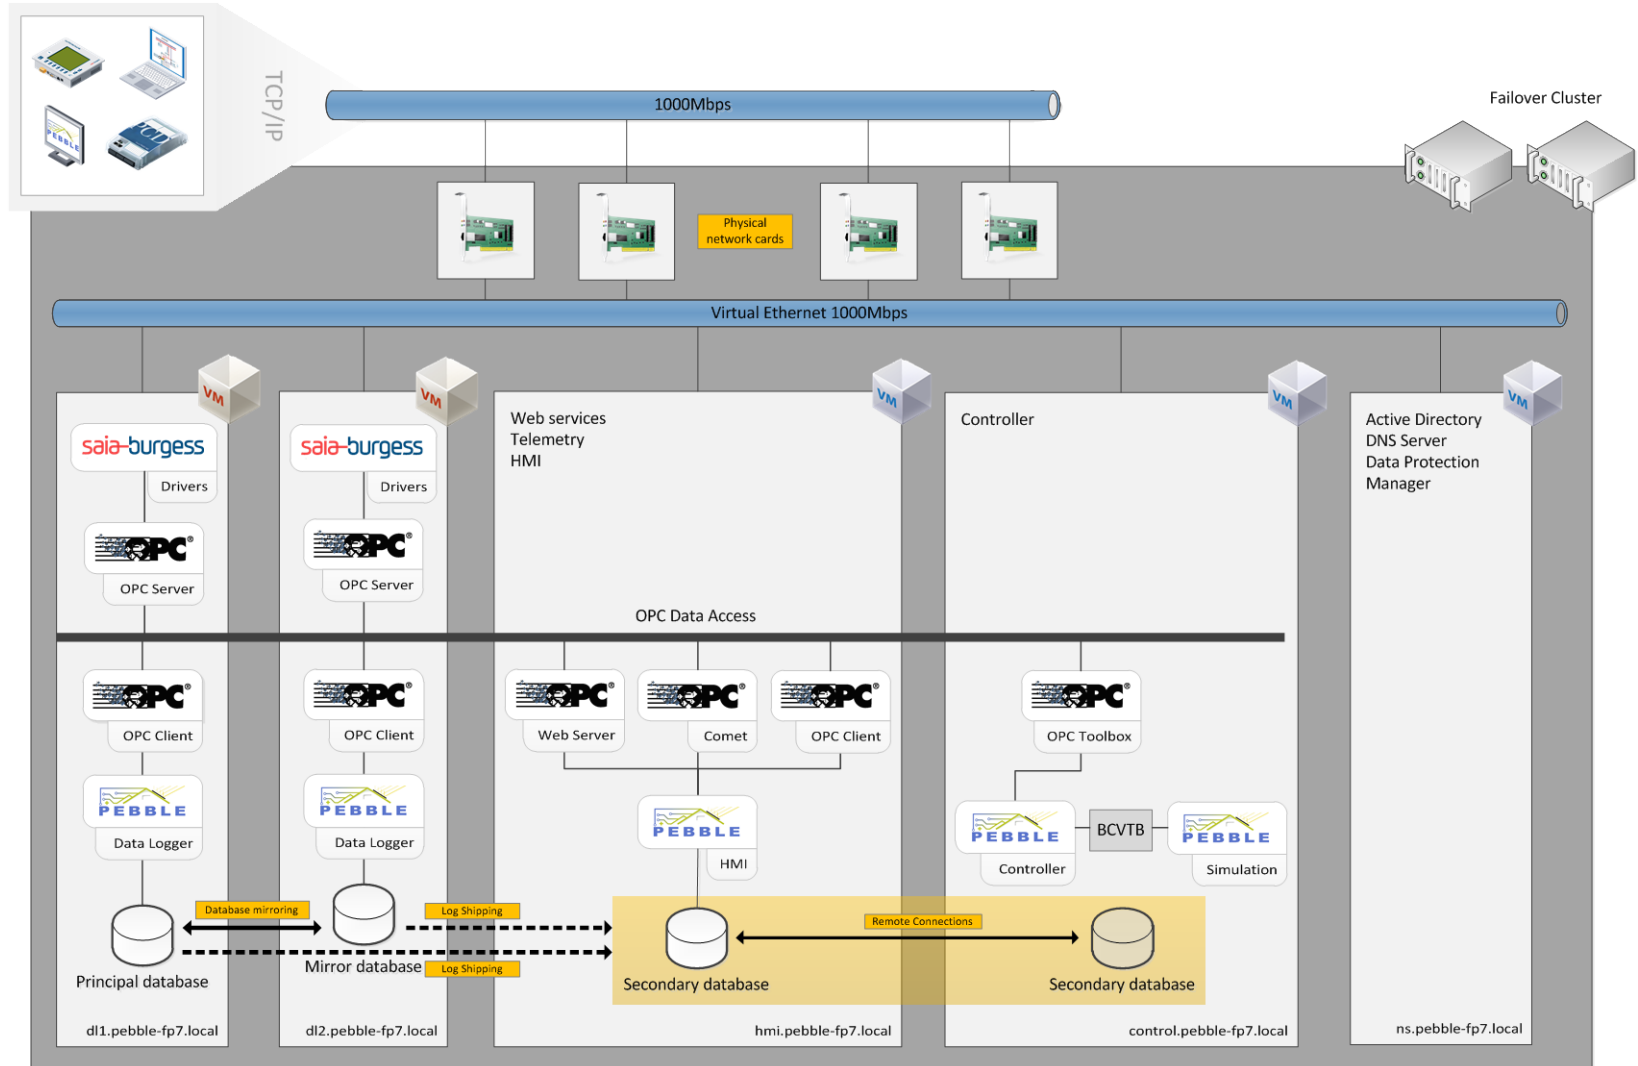

- “Static Data” warehouses for the main Data Model design.
- “Dynamic Data” warehouses for data delivery and historical diagrams.
- Comet server for real time data streaming through the Web.
- Ajax enabled UI components for the best interactive user experience.
- Shared code files in virtual directory that every PEBBLE UI can call and execute.

Infrastructure

System Architecture
